

Introduction

This document outlines the User and System Requirements for the Automated Client Booking and Itinerary Management System at IsleGo Travel & Logistics. The purpose of this system is to replace the agency's manual, spreadsheet-based workflows with a centralized, cloud-based platform. By automating itinerary creation, coordinating vendor payments and providing a collaborative workspace, the system aims to reduce client response times, eliminate scheduling errors, and support the agency's goal of scaling booking capacity by 30%.

User Requirements

User requirements define what the different stakeholders (Travel Coordinators, Management and Clients) need the system to do in order to perform their tasks effectively.

Travel Coordinators

Travel Coordinators are the primary internal users of the system. They require tools that streamline the planning and execution of complex group vacations.

- **Visual Task Management:** Coordinators must be able to view project timelines, task dependencies and milestones through a visual interface (such as a Gantt chart or Kanban board).
- **Automated Itinerary Generation:** The system must allow coordinators to automatically generate professional itinerary drafts based on inputted booking data and reducing manual formatting time.
- **Vendor Coordination:** Coordinators must be able to track vendor confirmation deadlines, payment schedules (hotels, transport, tours) and contract statuses within specific travel projects.
- **Centralized Client Data:** Coordinators require immediate access to a secure, centralized repository containing client preferences, passport details and historical booking data.

Management

Management requires oversight capabilities to ensure operational efficiency and to monitor the agency's capacity.

- Real-Time Dashboard: Management must have access to a high-level dashboard providing real-time visibility into the status of all active vacation projects.
- Resource Allocation: The system must allow management to view staff workloads and operational capacity to ensure that no customer requests are declined due to mismanaged resources.
- Performance Tracking: Management needs the ability to track key performance indicators, specifically client response times and the frequency of scheduling errors.

Clients

Clients interact with the outputs of the system and require timely, accurate and professional communication.

- Professional Documentation: Clients must receive fast, accurate, and professional-looking itinerary drafts.
- Real-Time Updates: Clients require automated or rapid updates when booking details, schedules, or vendor confirmations change.

System Requirements

System requirements specify the technical capabilities, constraints and performance standards the software must meet to satisfy the user requirements. These are divided into Functional and Non-Functional requirements.

3.1 Functional Requirements

Functional requirements describe the specific behaviours and functions the system must support.

Requirement ID	Feature Category	Description
FR-01	Data Management	The system shall provide a centralized database to securely store client profiles, including passport details, dietary preferences, and contact information.
FR-02	Project Tracking	The system shall support the creation of individual "travel projects" with customizable templates for standard vacation milestones.
FR-03	Task Dependencies	The system shall allow users to link tasks (e.g., "Book Hotel" must precede "Send Final Itinerary") and visually display these dependencies.
FR-04	Document Generation	The system shall automatically generate client-facing itinerary documents by pulling data from the project timeline and vendor details.

FR-05	Vendor Management	The system shall track vendor payment deadlines and contract statuses, triggering alerts for upcoming or overdue actions.
FR-06	Collaboration	The system shall allow multiple travel coordinators to access, edit, and leave comments on the same travel project simultaneously.

Non-Functional Requirements

Non-functional requirements define system attributes such as performance, usability, and security.

Requirement ID	Attribute	Description
NFR-01	Performance	The system must facilitate a reduction in client itinerary response and confirmation times from 48 hours to under 4 hours.
NFR-02	Accuracy	The system's automated validation and centralized data must support the operational goal of reducing internal scheduling and vendor booking errors to 0%.
NFR-03	Usability	The system must feature an intuitive, drag-and-drop interface (low-code SaaS) that requires no specialized technical skills, ensuring 100% staff adoption after a 3-day training workshop.
NFR-04	Accessibility	As a cloud-based platform, the system must be accessible via standard office computers and standard web browsers with a stable internet connection.
NFR-05	Security	The system must securely store sensitive client information (e.g., passport details) in compliance with standard data protection protocols, utilizing role-

		based access control to restrict data visibility.
NFR-06	Scalability	The system architecture must be capable of supporting a 30% increase in quarterly booking capacity (an additional 5 to 7 large group packages per month) without degrading performance.

Hardware and Software Specifications

To ensure the successful implementation, the following technical specifications are defined for the booking platform.

Software Specifications

- Operating System: Compatible with Windows 10/11 and macOS for internal staff use.
- Web Browser: Optimized for the latest versions of Google Chrome, Microsoft Edge, and Safari.
- Platform: Low-code SaaS Project Management and CRM platform (e.g., TeamGantt, Monday.com or similar cloud-based booking solution).
- Integration: Capability to integrate with standard email clients (Outlook/Gmail) and calendar applications for automated notification syncing.
- Database: Cloud-hosted SQL or NoSQL database provided by the SaaS vendor with automatic daily backups.

Hardware Specifications

- Internal Workstations: Standard office laptops or desktops with a minimum of 8GB RAM and an i5 processor (or equivalent) to handle browser-based multitasking.
- Network Infrastructure: Stable high-speed internet connection (minimum 10 Mbps upload/download) to ensure real-time synchronization of the cloud platform.
- Mobile Access: Smartphones or tablets (iOS/Android) for travel coordinators to access project statuses while in the field or during eco-tourism excursions.

Conclusion

These requirements have been developed to directly address the operational inefficiencies identified at IsleGo Travel & Logistics. By focusing on automated itinerary generation and centralized data management, the proposed system provides a robust solution that is both technically feasible and economically justified.
